Let's Start!

Let's Work with Deployment Diagrams!

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Give detailed information related to UML and common related topics.

Ask your partner:

- What do you think the most effective diagram to check interactions between hardware and software is? Why?
- How can you avoid confusions between diagram notations?

Can Do Statements:

- I can explain how the deployment diagram works.
- I can give details about the deployment diagram.
- I can identify key features related to the deployment diagram.

Let's Explore!

Charles suggests he and his colleague use the deployment diagram for their next project.

Instructions: Read the text below.

- Charles:** Well, for this project I think the most appropriate diagram is Deployment. I'm checking the guidelines and that's what the clients require.
- John:** Really? Why?
- Charles:** Because deployment diagrams present a fixed view of the processing nodes. In this project, we will need to verify how software, middleware and hardware connect and interact with each other.
- John:** We need to know about that. I'm reading here that this project needs those static views. But, are you sure that this is the most adequate model? We might want to try others, don't you think?
- Charles:** I'm sure this model will be the most helpful. We may be able to check how different machines work. For example, we would monitor the interactions between servers, laptops and mobile devices. That may be very convenient.
- John:** I see. Are there any other advantages to deployment diagrams?
- Charles:** I think they're one of the most versatile models for software artifacts and architecture. We might use it to explore the way embedded systems and their nodes interact by showing the type of connection that they establish.
- John:** When you talk about nodes, what do they contain?
- Charles:** They may contain artifacts, software components, a deployment specification and even other nodes. But, if we decide to use this diagram we should be careful with notation.
- John:** I was going to mention that. These diagrams might become too large, so the most logical thing to do is to agree on a fixed notation to prevent confusions. But I agree with you, especially because we may need to learn more about the system, and I think we will have to install it, maintain it and support it.
- Charles:** Exactly! As I said, this is the most convenient kind of diagram for this project. Let's start modeling, then!

**Let's Practice!**

Charles and John discuss about the best way to approach the project.

Instructions: Read the dialogue. Underline the wrong expressions. Rewrite the dialogue on the lines provided. Read the dialogue aloud with a partner. Check your pronunciation with your instructor.

John: I'm reading here that this project needs those static views. But, are you sure that this is the most adequate model? We mint try exploring others, right?

Charles: I'm sure this model ill be the most helpful. We jay be able to check how different machines work. For example, we wood monitor the interactions between servers, laptops and mobile devices. That sight be very convenient.

**Let's Practice!**

John identifies key features related to deployment diagrams.

Instructions: Read the text. Chose from the words in the box to correctly complete the text. Use: we may need, the most, I agree, is to agree, I think, might

These diagrams _____ become too large, so _____ logical thing to do _____ on a fixed notation to prevent confusions. But _____ with you, especially because _____ to learn more about the system, and _____ we will have to install it, maintain it and support it.

Extension Activity

Time to find out more about deployment diagrams.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about deployment diagrams.
- Select and organize those features you consider interesting.
- Make a brochure in which you present these features.
- Share your findings with the class.

Self-Assessment

Yes

No

1. I get more information on deployment diagrams.

☐
☐

2. I select and organize relevant information about the topic in a brochure.

☐
☐

3. I share my findings with the class.

☐
☐

Target Words

- **require (verb):** to demand, to ask for or to need something
e.g. I'm checking the guidelines and that's what the clients require.
- **middleware (noun):** intermediate that assists in communications between devices or systems
e.g. In this project, we will need to verify how software, middleware and hardware connect and interact with each other.
- **embedded (adjective):** fixed, rooted or encased
e.g. We might use it to explore the way embedded systems and their nodes interact by showing the type of connection that they establish.

- **careful (adjective):** attentive, thorough or mindful
e.g. If we decide to use this diagram we should be careful with notation.

- **large (adjective):** very big, enormous or extended
e.g. These diagrams might become too large, so the most logical thing to do is to agree on a fixed notation to prevent confusions.

- **maintain (verb):** support, help or assist
e.g. We may need to learn more about the system, and I think we will have to install it, maintain it and support it.

Learning Points

Superlatives

You can use **Superlatives** to talk about a **noun** or **group of nouns** that have a highly-developed **quality**.

In order to use **superlatives** with **short adjectives**, you need to use the definite article **the**, and the adjective with the **-est** suffix.

Remember, short adjectives have only one or two syllables.

Examples:

The fastest way to determine the right project is by analyzing the client's need.
Digital tools offer **the simplest** approach to organize modeling diagrams.

When you have **long adjectives** (two or more syllables), you need to use the definite article **the**, the particle **most** and the adjective.

Examples:

The most challenging part of doing a diagram is to follow it.
Even **the most advanced** program can't create a bug-free system.

Examples

- *Well, for this project I think the most appropriate diagram is Deployment. I'm*
- *I'm sure this model will be the most helpful.*

Learning Points

Modal Verbs

You can use the modal verbs **May, Might, Will** and **Would** to talk about possibilities in the future.

These modal verbs vary in degree when talking about possibilities, will expresses a high probability of something happening, while might expresses a low probability.

Will – **strong probability**

May

Would

Might- **weak possibility**

In order to use them you need to follow this structure

subject + modal verb + main verb (base form) + complement

Examples:

*We **may** switch to a better diagram soon.*

*There **might** be more candidates if we offer more benefits.*

In negative sentences, you put Not after the modal verb and then the main verb.

Examples:

*Our diagrams **will not** be very accurate with little data.*

*There **would not** be too many software architects who use that notation system.*

Examples

- *In this project, we will need to verify how software, middleware and hardware connect and interact with each other.*
- *We might want to try others, don't you think?*
- *They may contain artifacts, software components, a deployment specification and even other nodes.*
