Let's Start!

Let's learn about UML diagrams!

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Give detailed information related to UML and common related topics.

Ask your partner:

- Do you find it better to organize ideas in charts, diagrams, or plain text? Why?
- Do you use diagrams or sketches at work, school or university? Why? Why not?

Can Do Statements:

- I can give general information related to diagrams in UML.
- I can list some of the most important diagrams in UML.
- I can introduce some concepts related to UML diagrams.

Let's Explore!

Two students are reviewing UML concepts.

Instructions: Read the text below.

- Tyra:** Hey Brittany, we need to review some concepts for tomorrow, we have a test about diagrams in UML!
- Brittany:** I know! Let's see, I was reading about diagrams, it says that software engineers use diagrams to represent the different processes that will help them develop computer programs, and organize the set of instructions they are following in programming stages. Since UML refers to object-oriented modeling, we need to focus on the different options we have when developing software.
- Tyra:** Yes, some of the most important are behavior, interaction and structure diagrams. Right?
- Brittany:** Yes. Behavior diagrams show activities, states and cases. If we develop software using these diagrams now, we will see trends in the future as well.
- Tyra:** Okay, wait a minute, I was writing what you said. So, I see that interaction diagrams focus more on the way objects are interacting with one another, it includes sequences and timing.
- Brittany:** Correct. Finally, we have structure diagrams. We were reviewing them in our last class, they don't take time into account, but focus more on composite structure, packages, and deployment diagrams, which show the execution architecture of the systems.
- Tyra:** Okay, so those are the most important ones, but I'm thinking about the test; do you think we will have to give an example of each?
- Brittany:** I was talking to other classmates, but they said they didn't know. However, I'm doing some examples of my own, because instructors think that if we do them today, we will get to practice and pass the exam.
- Tyra:** I know! After all, modeling is one of the first stages in software development. If we have a great modeling structure right now, creating software is not going to be as hard in the future. Why don't we create different diagrams based on the most important ones, in case we have to do that during the exam?
- Brittany:** Good idea!

Let's Practice!

These are some important diagrams in UML.

Instructions: Read the sentences. Type the missing in the blanks. Use: we will use, are not taking time, we are developing. Practice saying the sentences aloud. Check your pronunciation with your instructor.

1. If _____ software using behaviors diagrams now, we will see trends as well.
2. If we are including sequences and timing right now, _____ the interaction diagrams for that purpose.
3. If we _____ time into account, we will use the structure diagram to make this software.

Let's Practice!

There are some others diagrams in UML that we can use.

Instructions: Circle the correct words to complete the sentence.

1. I was (talk / talking / talked) to other classmates about class diagram. However, instructors (asks / are asking / are ask) us to create some examples to practice more.

2. I was (read / read / reading) about diagrams and I found one called deployment diagram. Now, I (am trying / tries / am try) to use it to see the execution architecture of systems.

Extension Activity

Let's talk about diagrams

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about diagrams in UML
- Choose four diagrams
- Make a chart to explain each diagram in UML
- Use first conditional with continuous sentences and time expressions with the examples of each diagram.
- Show your chart to your instructor.

Self-Assessment

Yes

No

- I search information about diagrams in UML.
- I understand the way of those diagrams work in UML.
- I explain how some diagrams work in UML.
- I use first conditional with continuous sentences and time expressions in my explanation.

☐ ☐☐ ☐☐ ☐☐ ☐

Target Words

- **develop** (verb): to create, to implement or to build
e.g. It says that software engineers use diagrams to represent the different processes that will help them develop computer programs.
- **of one's own** (idiom): that belongs to someone (depending on the subject)
e.g. I'm doing some examples of my own, because instructors think that if we do them today, we will get to practice and pass the exam.
- **stage** (noun): phase, period or step
e.g. After all, modeling is one of the first stages in software development.
- **deployment** (noun): distribution, placement or dissemination
e.g. They don't take time into account, but focus more on composite structure, deployment and packages.
- **classmate** (noun): someone who takes classes with you
e.g. I was talking to other classmates, but they said they didn't know.
- **timing** (noun): schedule, time control or measurement
e.g. Interaction diagrams focus more on the way objects are interacting with one another, it includes sequences and timing.

Learning Points

Present Continuous vs. Past Continuous

You can use continuous tenses to refer to actions that are/were taking place or in development.

You use **present continuous** to talk about actions that are happening at the same moment of speaking.

To make affirmative sentences, you can use the following structure:

Subject + verb to be (am/is/are) + verb (ing form) + complement

Example:

I **am using** this modeling approach right now.

Note: You can also use contractions in this tense:

Example:

She's **having** problems with her keyboard.

We use **past continuous** to make a reference to actions that occurred during a period of time in the past.

To make affirmative sentences you can follow this structure:

Subject + verb to be in past (was/were) + verb (ing form) + complement

Example:

Janet **was working** on the program yesterday.

We **were talking** to our boss about the advantages of structure diagrams.

Examples

- *Let's see, I was reading about diagrams, it says that software engineers use diagrams to represent the different processes that will help them develop computer programs.*
- *Finally, we have structure diagrams. We were reviewing them in our last class,*
- *However, I'm doing some examples of my own, because instructors think that if we do them today, we will get to practice and pass the exam.*

Learning Points

First Conditional with Continuous Sentences and Time Expressions

You use the **first conditional** to talk an action that may have an impact in the future.

The **first conditional** contains two clauses, the first one is the condition, and the second one is the result of the condition.

The “**if**” clause (**condition**) goes in simple present or present continuous, while the second clause (**result**) goes in future simple.

You can use time expressions to show that the action is happening at a specific moment. Some time expressions for continuous tenses include: now, right now, at this moment, as we speak, and nowadays, etc.

Follow this structure to build a sentence in the first conditional:

(condition) (result)
If + present simple + , + future simple.

Examples:

If **you use** UML now, you **will develop** software faster.

If **you're using** UML now, you **will develop** software faster.

When you use present continuous, you refer to current actions or arrangements.

Example:

If the interaction diagram **is not showing** how objects interact at this moment, we will have to create a new one!

Note: if you write the result before the condition, the comma is not necessary in the middle.

Example:

You **will develop** software faster if you use diagrams **right now**.

Examples

- *However, I'm doing some examples of my own, because instructors think that if we do them today, we will get to practice and pass the exam.*
- *If we have a great modeling structure right now, creating software is not going to be as hard in the future.*
- *If we develop software using these diagrams now, we will see trends in the future as well.*
